# Zeroing out plus group

- 26.1i_1Reg_Cont_Upd_No_wAI_LLS_plus_group_0
- 26.2b_FAA_3Flt_LLS_Only_plus_group_0

- Little difference in overall population dynamics and model fits
- Suggests that plus group effect has small influence on overall interpretation of population dynamics

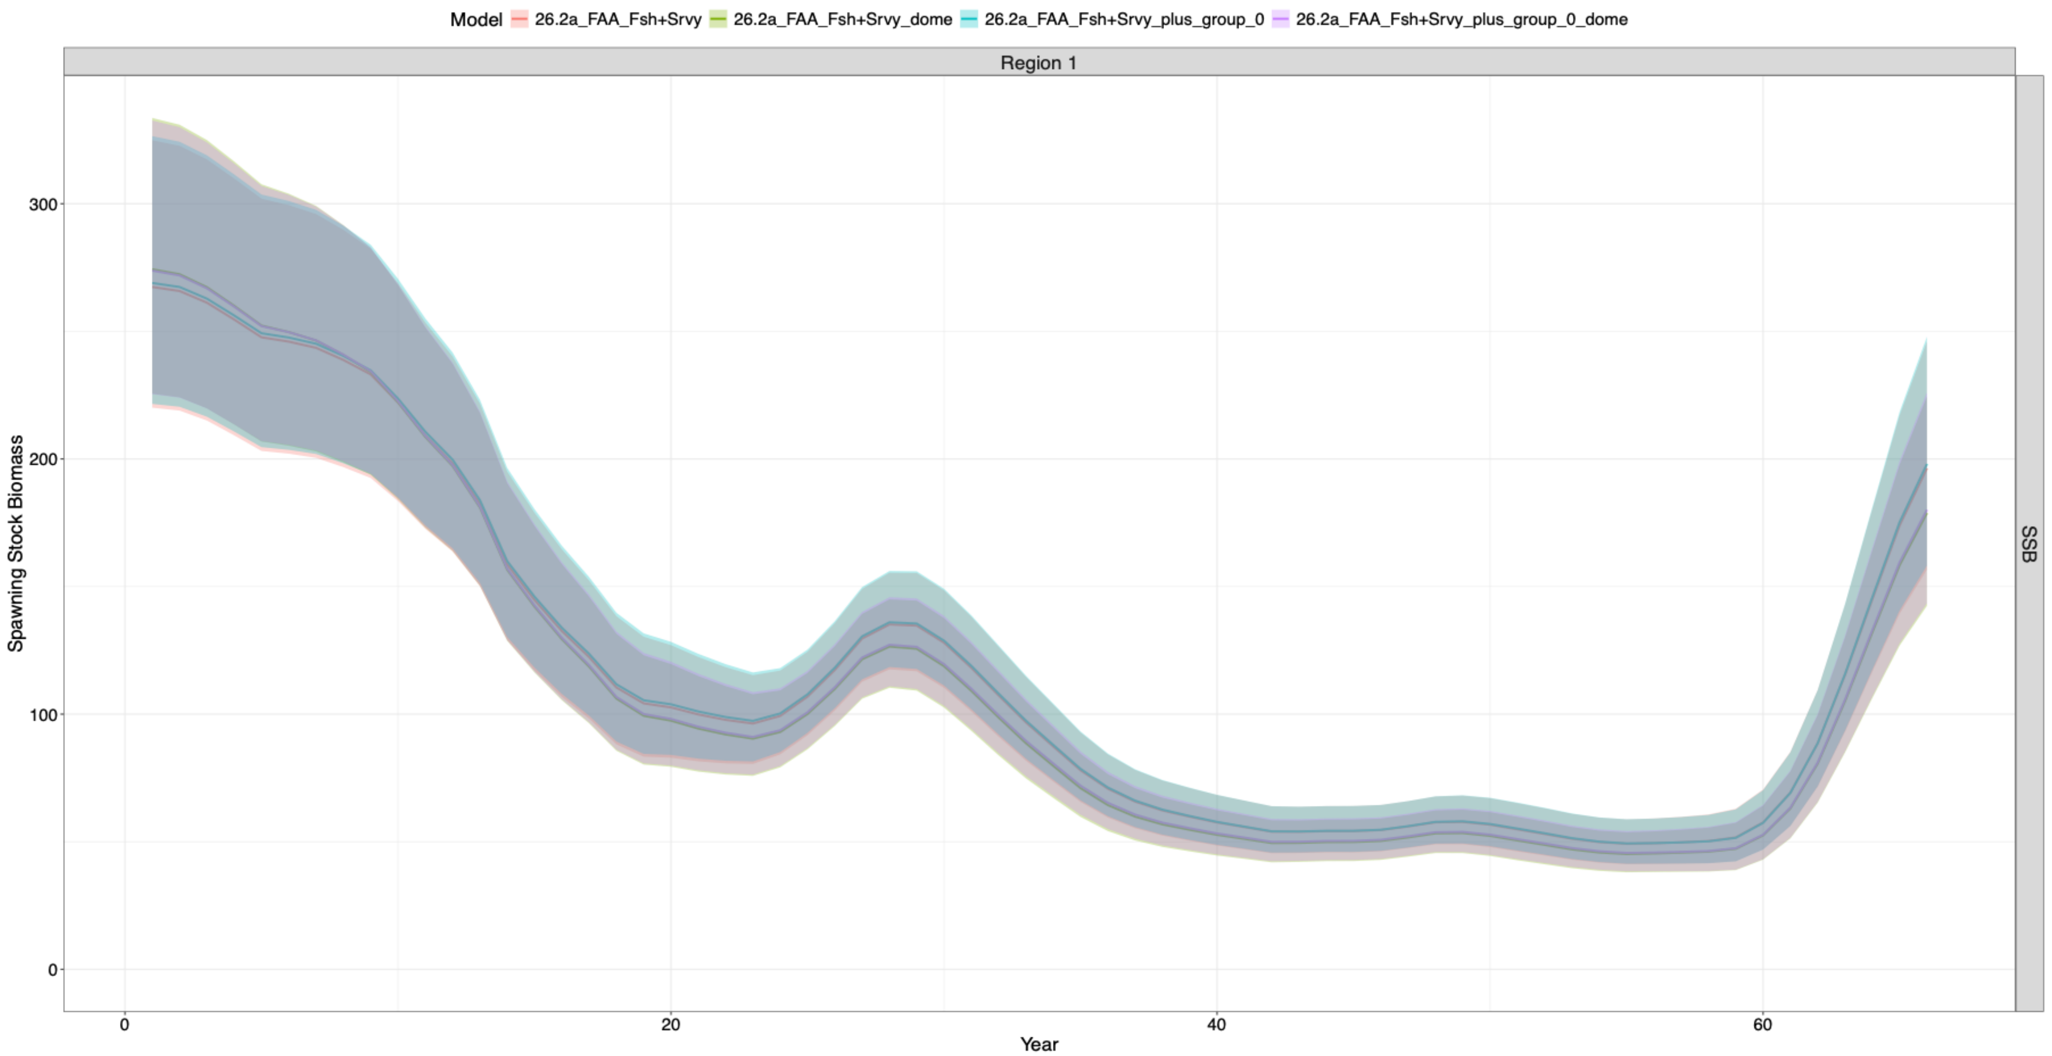
# Zeroing out plus group and adding a dome to the AI

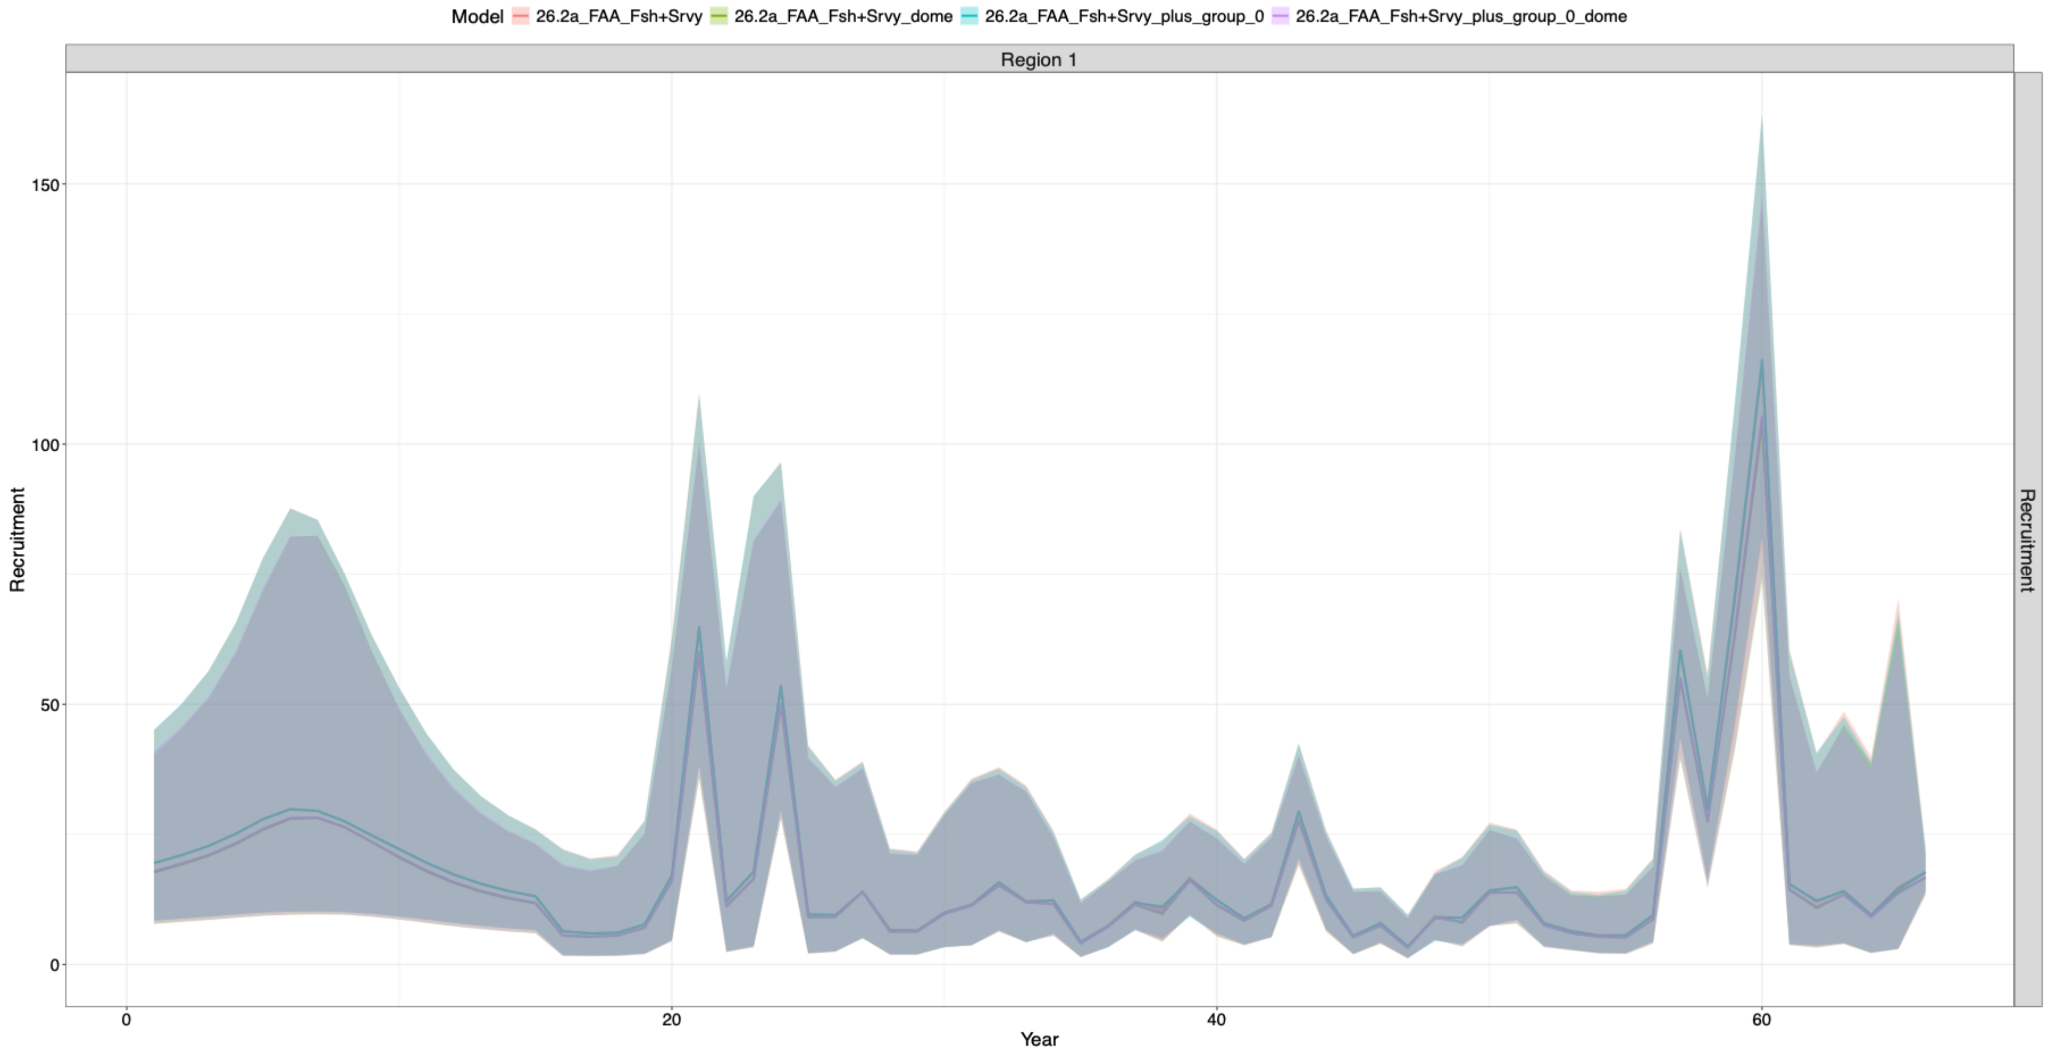
- 26.2a_FAA_Fsh+Srvy_plus_group_0
- 26.2a_FAA_Fsh+Srvy_dome
- 26.2a_FAA_Fsh+Srvy_plus_group_0_dome

- Little difference in overall population dynamics and model fits
- Suggests that plus group effect and selectivity choice in the AI has small influence on overall interpretation of population dynamics
- Differences in selectivity when zeroing plus group and doming
  - Doming becomes less extreme when zeroing out plus group (need to try to remove these individuals since no longer observing them in the model)
- Likely due to low catches in the AI region relative to the GOA

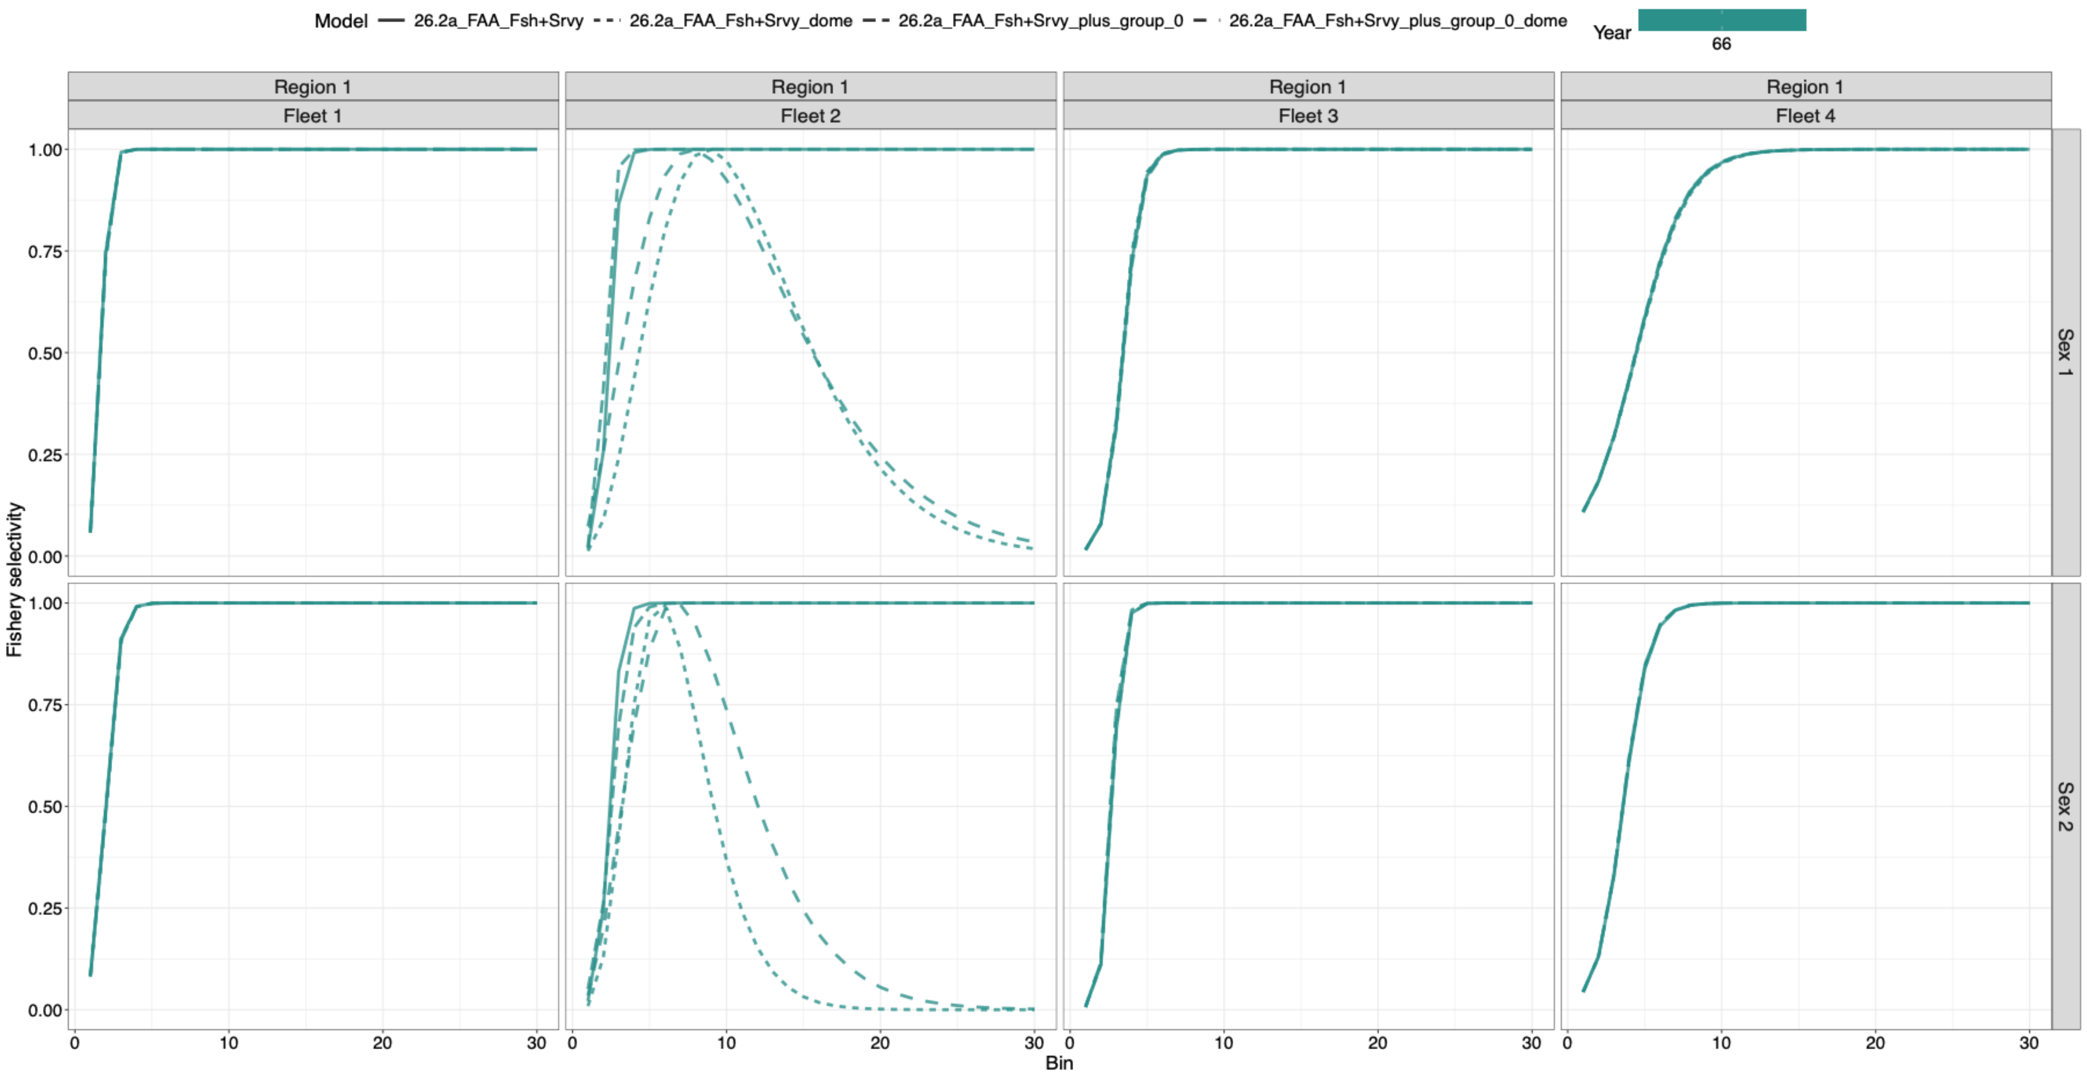
# Zeroing out plus group and adding a dome to the AI



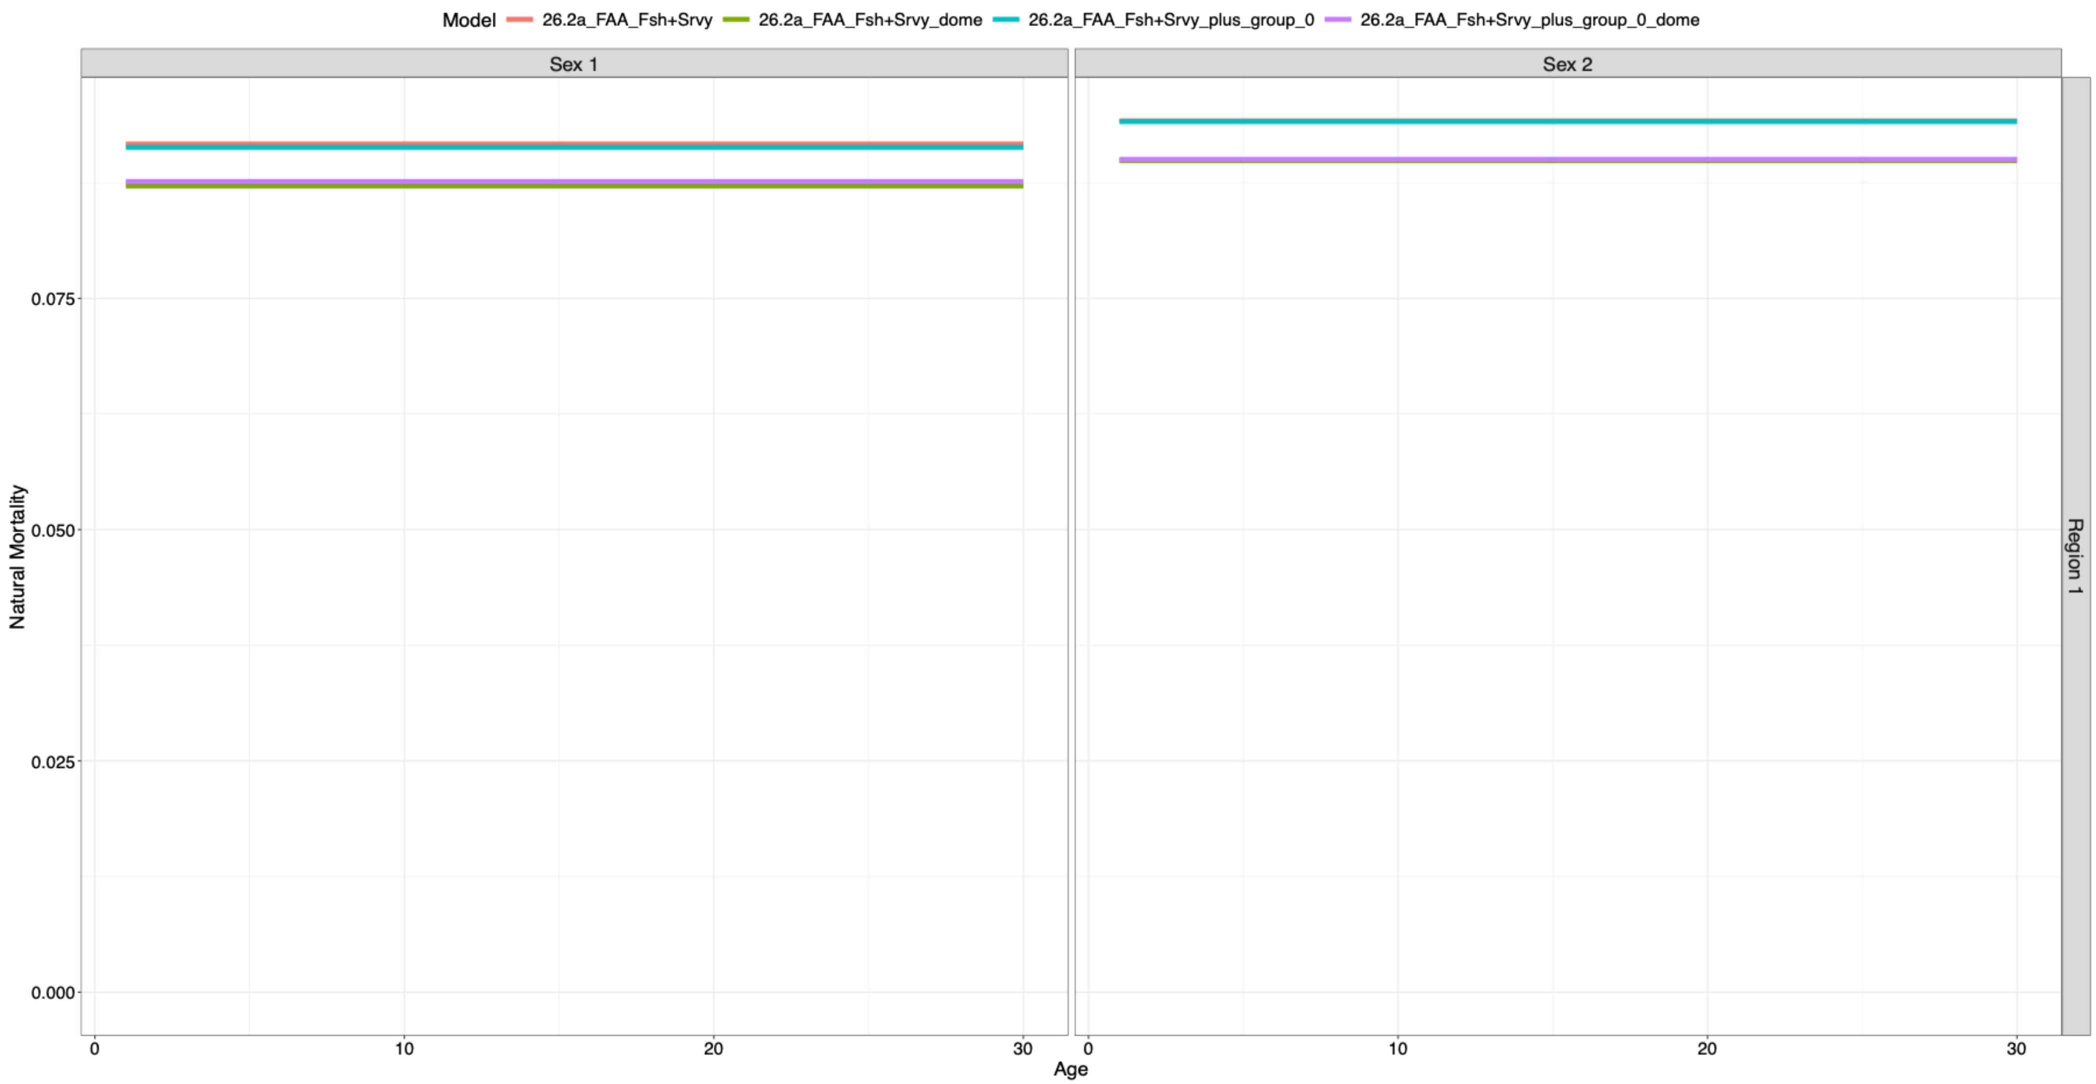
# Zeroing out plus group and adding a dome to the AI



# Zeroing out plus group and adding a dome to the AI

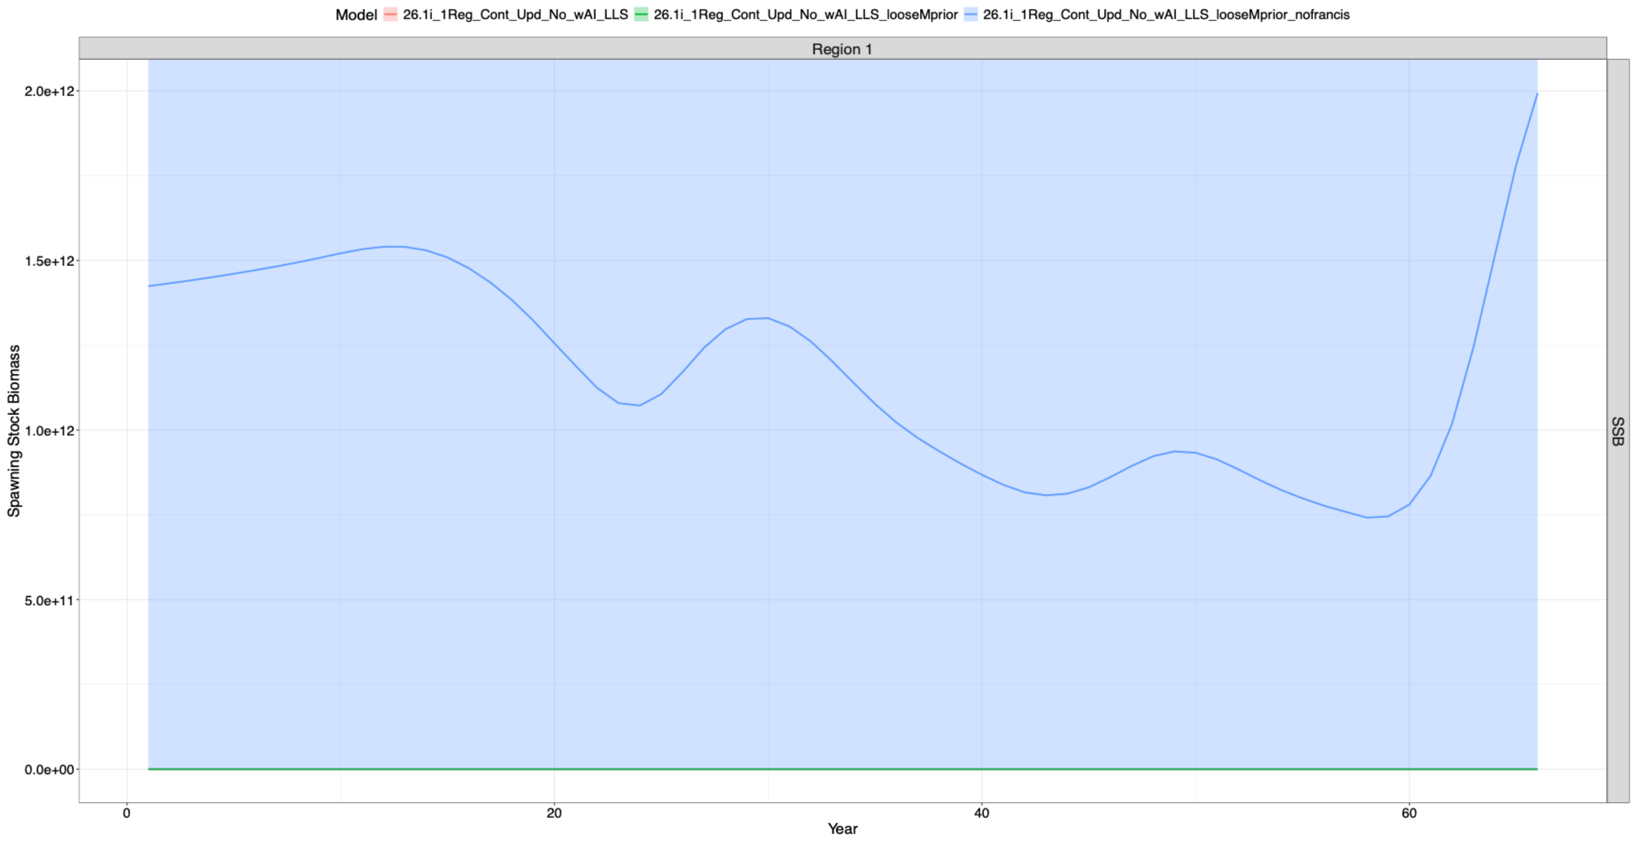


# Zeroing out plus group and adding a dome to the AI



# Loosening the M prior

- Changing 26.1i_1Reg_Cont_Upd_No_wAI_LLS
- Change M sd prior from 0.1 to 0.3
- Model "converges" but scale seems implausible



# Loosening the M prior

- Changing 26.2b_FAA_3Flt_LLS_Only
- Similar results to single region sensitivity model …
- Change M sd prior from 0.1 to 0.3
- Model “converges” but scale seems implausible
